## Chapter 5: Lines and Angles

- (c) A zero angle
- (d) A right angle

Question 13. If in the given figure  $l \parallel m$  then :

- (a)  $x = 50^\circ$
- (b)  $x = 60^\circ$
- (c) No relation

Question 14. What are the lines which lie on the same plane and do not intersect at any point called?

- (a) Perpendicular lines
- (b) Intersecting lines
- (c) Parallel lines
- (d) Collinear lines

Question 15. In the given figure value of  $x$  is :

- (a)  $45^\circ$
- (b)  $55^\circ$
- (c)  $65^\circ$
- (d) None of these

### Very Short Questions :

1. Find the angles which is  $\frac{1}{5}$  of its complement.
2. Find the angles which is  $\frac{2}{3}$  of its supplement.
3. Find the value of  $x$  in the given figure.

4. In the given figure, find the value of  $y$ .

5. Find the supplements of each of the following:

- (i)  $30^\circ$
- (ii)  $79^\circ$
- (iii)  $179^\circ$
- (iv)  $x^\circ$
- (v)  $\frac{2}{5}$  of right angle

6. If the angles  $(4x + 4)^\circ$  and  $(6x - 4)^\circ$  are the supplementary angles, find the value of  $x$ .

7. Find the value of  $x$ .

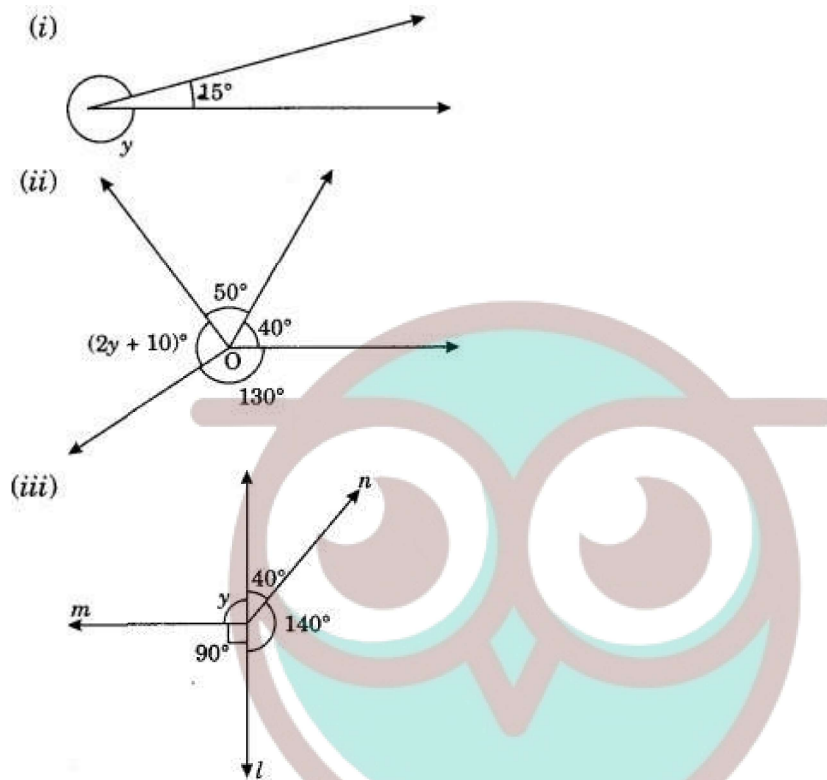

8. Find the value of  $y$ .

**Short Questions :**

1. Find the value of  $y$  in the following figures:

2. In the following figures, find the lettered angles.

3. In the given figure, prove that  $AB \parallel CD$ .

4. In the given figure  $l \parallel m$ . Find the values of  $a$ ,  $b$  and  $c$ .

5. In the adjoining figure if  $x : y : z = 2 : 3 : 4$ , then find the value of  $z$ .

**Long Questions :**

1. In the following figure, find the value of  $\angle BOC$ , if points A, O and B are collinear.

2. In given figure, PQ, RS and UT are parallel lines.

(i) If  $c = 57^\circ$  and  $a = \frac{c}{3}$ , find the value of  $d$ .

(ii) If  $c = 75^\circ$  and  $a = \frac{2}{5}c$ , find

3. An angle is greater than  $45^\circ$ . Is its complementary angle greater than  $45^\circ$

or equal to  $45^\circ$  or less than  $45^\circ$ ?

4. In the adjoining figure,  $p \parallel q$ . Find the unknown angles.

### Assertion and Reason Questions:

**1.) Assertion:** When the sum of the measures of two angles is  $90^\circ$ , the angles are called complementary angles.

**Reason:** Two acute angles can be complementary to each other.

- a.) Both Assertion and Reason are correct and Reason is the correct explanation for Assertion  
 b.) Both Assertion and Reason are correct and Reason is not the correct explanation for Assertion.  
 c.) assertion is true but the reason is false.  
 d.) both assertion and reason are false.

**2.) Assertion:** The sum of the measures of two complementary angles is  $90^\circ$ .

**Reason:** When the sum of the measures of two angles is  $90^\circ$ , the angles are called complementary angles.

- a.) Both Assertion and Reason are correct and Reason is the correct explanation for Assertion  
 b.) Both Assertion and Reason are correct and Reason is not the correct explanation for Assertion.  
 c.) assertion is true but the reason is false.  
 d.) both assertion and reason are false.

### ANSWER KEY -

#### Multiple Choice questions :

1. (c) None of these
2. (a)  $25^\circ$
3. (a)  $90^\circ$
4. (c)  $63^\circ, 27^\circ$
5. (a)  $20^\circ$
6. (c) Remains the same
7. (d) None of these
8. (b)  $75^\circ$
9. (a)  $x = 60^\circ$
10. (c)  $112^\circ, 68^\circ$

11. (a)  $180^\circ$   
 12. (c) A zero angle  
 13. (a)  $x = 50^\circ$   
 14. (c) Parallel lines  
 15. (a)  $55^\circ$

### Very Short Answer :

1. Let the required angle be  $x^\circ$

its complement =  $(90 - x)^\circ$

As per condition, we get

$$\begin{aligned} & \frac{1}{5} \text{ of } (90 - x)^\circ = x^\circ \\ \Rightarrow & \frac{1}{5} \times (90 - x)^\circ = x^\circ \\ \Rightarrow & \frac{1}{5} \times 90^\circ - \frac{1}{5} \times x^\circ = x^\circ \\ \Rightarrow & 18^\circ - \frac{1}{5} x^\circ = x^\circ \\ \Rightarrow & x^\circ + \frac{1}{5} x^\circ = 18^\circ \\ \Rightarrow & \frac{6}{5} x^\circ = 18^\circ \\ \therefore & x^\circ = 18 \times \frac{5}{6} = 15^\circ \end{aligned}$$

Thus, the required angle be  $15^\circ$ .

2. Let the required angle be  $x^\circ$ .

its supplement =  $(180 - x)^\circ$

As per the condition, we get

$$\frac{2}{3} \text{ of } (180 - x)^\circ = x^\circ$$

$$\Rightarrow \frac{2}{3} \times (180 - x)^\circ = x^\circ$$

$$\Rightarrow \frac{2}{3} \times 180^\circ - \frac{2}{3} \times x^\circ = x^\circ$$

$$\Rightarrow 120^\circ - \frac{2}{3}x^\circ = x^\circ$$

$$\Rightarrow x^\circ + \frac{2}{3}x^\circ = 120^\circ$$

$$\Rightarrow \frac{5}{3}x^\circ = 120^\circ$$

$$\therefore x^\circ = 120^\circ \times \frac{3}{5} = 72^\circ$$

Thus, the required angle be  $72^\circ$ .

3.  $\angle POR + \angle QOR = 180^\circ$  (Angles of linear pair)

$$\Rightarrow (2x + 60^\circ) + (3x - 40^\circ) = 180^\circ$$

$$\Rightarrow 2x + 60 + 3x - 40 = 180^\circ$$

$$\Rightarrow 5x + 20 = 180^\circ$$

$$\Rightarrow 5x = 180 - 20 = 160$$

$$\Rightarrow x = 32$$

Thus, the value of  $x = 32$ .

4. Let the angle opposite to  $90^\circ$  be  $z$ .

$$z = 90^\circ \text{ (Vertically opposite angle)}$$

$$3y + z + 30^\circ = 180^\circ \text{ (Sum of adjacent angles on a straight line)}$$

$$\Rightarrow 3y + 90^\circ + 30^\circ = 180^\circ$$

$$\Rightarrow 3y + 120^\circ = 180^\circ$$

$$\Rightarrow 3y = 180^\circ - 120^\circ = 60^\circ$$

$$\Rightarrow y = 20^\circ$$

5. Thus the value of  $y = 20^\circ$ .

(i) Supplement of  $30^\circ = 180^\circ - 30^\circ = 150^\circ$

(ii) Supplement of  $79^\circ = 180^\circ - 79^\circ = 101^\circ$

(iii) Supplement of  $179^\circ = 180^\circ - 179^\circ = 1^\circ$

(iv) Supplement of  $x^\circ = (180 - x)^\circ$

(v) Supplement of  $\frac{2}{5}$  of right angle

$$= 180^\circ - \frac{2}{5} \times 90^\circ = 180^\circ - 36^\circ = 144^\circ$$

6.  $(4x + 4)^\circ + (6x - 4)^\circ = 180^\circ$  ( $\because$  Sum of the supplementary angle is  $180^\circ$ )

$$\Rightarrow 4x + 4 + 6x - 4 = 180^\circ$$

$$\Rightarrow 10x = 180^\circ$$

$$\Rightarrow x = 18^\circ$$

$$\text{Thus, } x = 18^\circ$$

7.  $(6x - 40)^\circ + (5x + 9)^\circ + (3x + 15)^\circ = 180^\circ$  ( $\because$  Sum of adjacent angles on straight line)

$$\Rightarrow 6x - 40 + 5x + 9 + 3x + 15 = 180^\circ$$

$$\Rightarrow 14x - 16 = 180^\circ$$

$$\Rightarrow 14x = 180 + 16 = 196$$

$$\Rightarrow x = 14$$

$$\text{Thus, } x = 14$$

8.  $l \parallel m$ , and  $t$  is a transversal.

$$y + 135^\circ = 180^\circ \text{ (Sum of interior angles on the same side of transversal is } 180^\circ)$$

$$\Rightarrow y = 180^\circ - 135^\circ = 45^\circ$$

$$\text{Thus, } y = 45^\circ$$

### Short Answer :

1. (i)  $y + 15^\circ = 360^\circ$  (Sum of complete angles round at a point)

$$\Rightarrow y = 360^\circ - 15^\circ = 345^\circ$$

$$\text{Thus, } y = 345^\circ$$

- (ii)  $(2y + 10)^\circ + 50^\circ + 40^\circ + 130^\circ = 360^\circ$  (Sum of angles round at a point)

$$\Rightarrow 2y + 10 + 220 = 360$$

$$\Rightarrow 2y + 230 = 360$$

$$\Rightarrow 2y = 360 - 230$$

$$\Rightarrow 2y = 130$$

$$\Rightarrow y = 65$$

$$\text{Thus, } y = 65^\circ$$

- (iii)  $y + 90^\circ = 180^\circ$  (Angles of linear pair)

$$\Rightarrow y = 180^\circ - 90^\circ = 90^\circ$$

[ $40^\circ + 140^\circ = 180^\circ$ , which shows that  $l$  is a straight line]

2. (i) Let  $a$  be represented by  $\angle 1$  and  $\angle 2$

$$\angle a = \angle 1 + \angle 2$$

$$\angle 1 = 35^\circ \text{ (Alternate interior angles)}$$

$$\angle 2 = 55^\circ \text{ (Alternate interior angles)}$$

$$\angle 1 + \angle 2 = 35^\circ + 55^\circ$$

$$\angle a = 90^\circ$$

$$\text{Thus, } \angle a = 90^\circ$$

3.  $\angle CEF = 30^\circ + 50^\circ = 80^\circ$

$$\angle DCE = 80^\circ \text{ (Given)}$$

$$\angle CEF = \angle DCE$$

But these are alternate interior angle.

$$CD \parallel EF \dots\dots(i)$$

$$\text{Now } \angle EAB = 130^\circ \text{ (Given)}$$

$$\angle AEF = 50^\circ \text{ (Given)}$$

$$\angle EAB + \angle AEF = 130^\circ + 50^\circ = 180^\circ$$

But these are co-interior angles.

$$AB \parallel EF \dots(ii)$$

From eq. (i) and (ii), we get

$$AB \parallel CD \parallel EF$$

$$\text{Hence, } AB \parallel CD$$

Co-interior angles/Allied angles: Sum of interior angles on the same side of transversal is  $180^\circ$ .

4. (i) We have  $l \parallel m$

$$\angle b = 40^\circ \text{ (Alternate interior angles)}$$

$$\angle c = 120^\circ \text{ (Alternate interior angles)}$$

$$\angle a + \angle b + \angle c = 180^\circ \text{ (Sum of adjacent angles on straight angle)}$$

$$\Rightarrow \angle a + 40^\circ + 120^\circ = 180^\circ$$

$$\Rightarrow \angle a + 160^\circ = 180^\circ$$

$$\Rightarrow \angle a = 180^\circ - 160^\circ = 20^\circ$$

$$\text{Thus, } \angle a = 20^\circ, \angle b = 40^\circ \text{ and } \angle c = 120^\circ.$$

(ii) We have  $l \parallel m$

$$\angle a = 45^\circ \text{ (Alternate interior angles)}$$

$$\angle c = 55^\circ \text{ (Alternate interior angles)}$$

$$\angle a + \angle b + \angle c = 180^\circ \text{ (Sum of adjacent angles on straight line)}$$

$$\Rightarrow 45 + \angle b + 55 = 180^\circ$$

$$\Rightarrow \angle b + 100 = 180^\circ$$

$$\Rightarrow \angle b = 180^\circ - 100^\circ$$

$$\Rightarrow \angle b = 80^\circ$$

5. Let  $x = 2s^\circ$

$$y = 3s^\circ$$

$$\text{and } z = 4s^\circ$$

$$\angle x + \angle y + \angle z = 180^\circ \text{ (Sum of adjacent angles on straight line)}$$

$$2s^\circ + 3s^\circ + 4s^\circ = 180^\circ$$

$$\Rightarrow 9s^\circ = 180^\circ$$

$$\Rightarrow s^\circ = 20^\circ$$

$$\text{Thus } x = 2 \times 20^\circ = 40^\circ, y = 3 \times 20^\circ = 60^\circ \text{ and } z = 4 \times 20^\circ = 80^\circ$$

### Long Answer :

1. We have A, O and B are collinear.

$$\angle AOD + \angle DOC + \angle COB = 180^\circ \text{ (Sum of adjacent angles on straight line)}$$

$$(x - 10)^\circ + (4x - 25)^\circ + (x + 5)^\circ = 180^\circ$$

$$\Rightarrow x - 10 + 4x - 25 + x + 5 = 180^\circ$$

$$\Rightarrow 6x - 10 - 25 + 5 = 180^\circ$$

$$\Rightarrow 6x - 30 = 180^\circ$$

$$\Rightarrow 6x = 180 + 30 = 210$$

$$\Rightarrow x = 35$$

$$\text{So, } \angle BOC = (x + 5)^\circ = (35 + 5)^\circ = 40^\circ$$

2. (i) We have  $\angle c = 57^\circ$  and  $\angle a = \frac{\angle c}{3}$

$$\angle a = \frac{57}{3} = 19^\circ$$

$$PQ \parallel UT \text{ (given)}$$

$$\angle a + \angle b = \angle c \text{ (Alternate interior angles)}$$

$$19^\circ + \angle b = 57^\circ$$

$$\angle b = 57^\circ - 19^\circ = 38^\circ$$

$$PQ \parallel RS \text{ (given)}$$

$$\angle b + \angle d = 180^\circ \text{ (Co-interior angles)}$$

$$38^\circ + \angle d = 180^\circ$$

$$\angle d = 180^\circ - 38^\circ = 142^\circ$$

$$\text{Thus, } \angle d = 142^\circ$$

(ii) We have  $\angle c = 75^\circ$  and  $\angle a = \frac{2}{5} \angle c$

$$\angle a = \frac{2}{5} \times 75^\circ = 30^\circ$$

PQ || UT (given)

$$\angle a + \angle b = \angle c$$

$$30^\circ + \angle b = 75^\circ$$

$$\angle b = 75^\circ - 30^\circ = 45^\circ$$

Thus,  $\angle b = 45^\circ$

3. Let us assume the complementary angles be p and q,  
We know that, sum of measures of complementary angle pair is  $90^\circ$ .

Then,

$$= p + q = 90^\circ$$

It is given in the question that  $p > 45^\circ$

Adding q on both the sides,

$$= p + q > 45^\circ + q$$

$$= 90^\circ > 45^\circ + q$$

$$= 90^\circ - 45^\circ > q$$

$$= q < 45^\circ$$

Hence, its complementary angle is less than  $45^\circ$ .

4. By observing the figure,

$$\angle d = 125^\circ \dots [\because \text{corresponding angles}]$$

We know that, Linear pair is the sum of adjacent angles is  $180^\circ$

Then,

$$= \angle e + 125^\circ = 180^\circ \dots [\text{Linear pair}]$$

$$= \angle e = 180^\circ - 125^\circ$$

$$= \angle e = 55^\circ$$

From the rule of vertically opposite angles,

$$\angle f = \angle e = 55^\circ$$

$$\angle b = \angle d = 125^\circ$$

By the property of corresponding angles,

$$\angle c = \angle f = 55^\circ$$

$$\angle a = \angle e = 55^\circ$$

**Assertion and Reason Answers:**

- 1) b.) Both Assertion and Reason are correct and Reason is not the correct explanation for Assertion.
- 2) a.) Both Assertion and Reason are correct and Reason is the correct explanation for Assertion.

*Swotters*
